

ASX MEDIA RELEASE 7TH AUGUST 2014

EXPLORATION UPDATE

- **JUMA EAST DATA INTEGRATION**

Integration of geological/geophysical data with soil sampling results received to date suggests the presence of pipelike alkalic bodies (strong As-V anomalies with associated magnetite) approximately 300-400m in diameter, superimposed on the interpreted fault controlled Au-Ag low sulphidation epithermal system at Guida target.

- **PROMINENT 10KM-LONG AEROMAGNETIC ANOMALY COINCIDENT WITH OLD GOLD WORKINGS AT GUIDA, PLATO, ACO AND BOIA VELHA TARGETS.**

- **SOIL SAMPLE RESULTS CONFIRM PREVIOUSLY ANNOUNCED METALLIC ASSOCIATION OF As-V-Mo-Cr-Ti-Fe OVER A BROAD 1.5KM DIAMETER ZONE**

- BBX TO CONDUCT AN AIRBORNE MAGNETIC AND RADIOMETRIC SURVEY OVER THE JUMA EAST TENEMENT BLOCK.
- BBX HAS APPLIED FOR 5 EXPLORATION LEASES TOTALLING 38,664 HA.

JUMA EAST

BBX is pleased to announce the latest results from the exploration program conducted at the Guida target – Juma East Gold Project.

BBX is conducting a greenfields exploration programme at its Juma East project, targeting epithermal and porphyry Au-Cu deposits, currently at regional scale focused along a major NW fault system where old workings for gold were recorded.

The attached data relate mainly to geochemical results for soil concentrates. The relative values which define anomalous zones for each element (see maps below) are therefore more relevant than the absolute values.

The 253 assay results for soil concentrates (appendix 2), collected over the Guida target on a 400m x 80m (grid) were statistically processed to define the anomalous values for each of the 36 elements analysed. These were then subsequently plotted and contoured on the relevant maps (see appendix, maps 1, 2, 3, 4) showing As, V, Cr, Mo and Ga distribution, plus the table with the correlation between the elements (appendix 1)).

The assay results support previous announcements regarding the geochemical signature typical of alkalic epithermal and porphyry systems over a 1.5 km diameter at Guida, but now incorporating two distinct internal anomalous zones ranging from 300 to 400m in diameter, defined principally by As-V and magnetite in soils.

A metal zonation is present with the As-V-rich centers surrounded by a zone of higher Mn values (map 5), with corresponding anomalous levels of Ba and higher Cu values (map 6) and coincident high Ni and Co values, also superimposed on the major 1.5 km diameter structure.

The granite basement immediately south of the Guida fault is clearly marked by very low values for most of the elements analysed.

T +55 21 2439 5700

An airborne geophysical survey conducted over Juma East by CPRM (Brazilian Geological Survey) on 500m-spaced lines defined a moderate magnetic anomaly at Guida, coincident with the presence of magnetite in soils and anomalous values for As-V-Cr-Mo (map 7). Subsequent soil sampling and mapping of soil lines to the west of Guida on the Plato target identified abundant magnetite in soils (photo 1) in a 400 m diameter zone associated with a strong magnetic feature. Narrow, sub-vertical veinlets containing magnetite were identified on the margin of this magnetic anomaly cutting a weathered sericite-kaolin-feldspar-quartz rock.

Photo 1 – 217003E/9261729N – RL181m, magnetite in soils at the Plato target

Regional reconnaissance conducted around the old gold workings at Aço, 6 km along strike from Guida, identified the same rock types and metallic association as at Guida in 4 soil concentrates. A prominent 10 km-long magnetic feature coincides with the old gold workings in alluvials and saprolite along the Guida/Boia Velha fault system (map 8).

Map 8 –Composite aeromagnetic map of the Analytical Signal + 1st Vertical Derivative

Typical low sulphidation textures were also identified in many locations on the latest 9 soil lines conducted over the Plato target (photo 2).

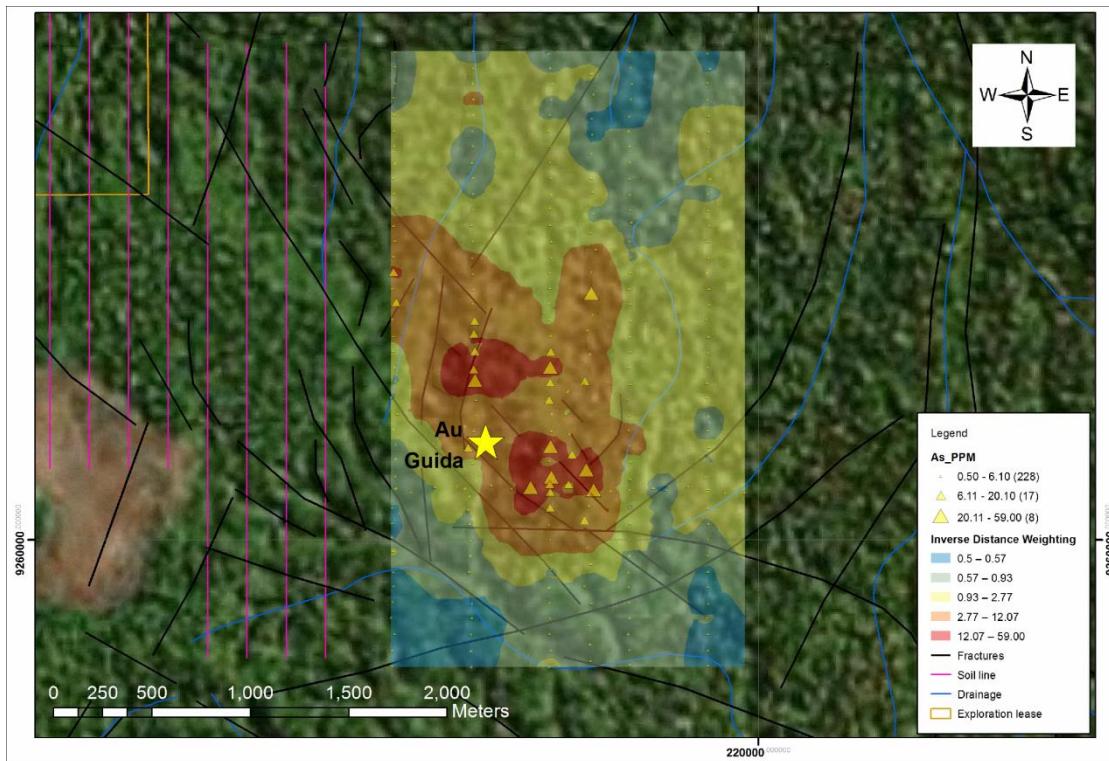

Photo 2 – 217211E/9260564N – RL 149m, Colloform sílica texture – typical of low sulphidation Au-Ag systems, between Guida and Plato targets.

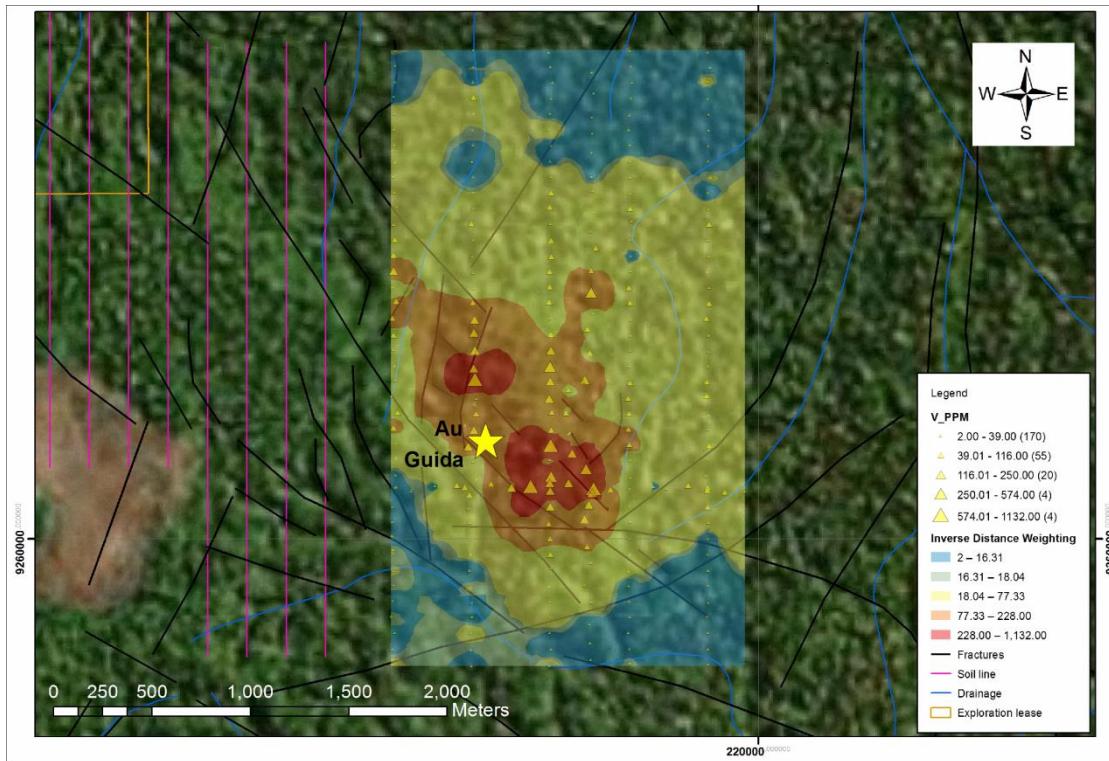

406 samples from the June/July field programme including duplicates and blanks from the 9 soil lines (200m x 80m grid) conducted over the Plato target, plus chip and channel samples have been submitted for analysis. Results are expected in early September.

BBX's geological team is currently extending the soil sampling to the west to cover the old Aço workings on a 400m x 80m grid and carrying out infill sampling at Guida on a 200m x 80m grid. This programme is scheduled for completion by 16th August and results are expected in late-September.

AIRBORNE MAGNETIC AND GAMMA SURVEY

A contract was signed on August 4th with CGG Airborne to conduct an aeromagnetic-radiometric geophysical survey over the Juma East tenement block. The airborne survey will comprise 2,630 line-km, 2,155km on 200m spaced lines and 475 km on infill lines to generate a 100m-spaced central grid.

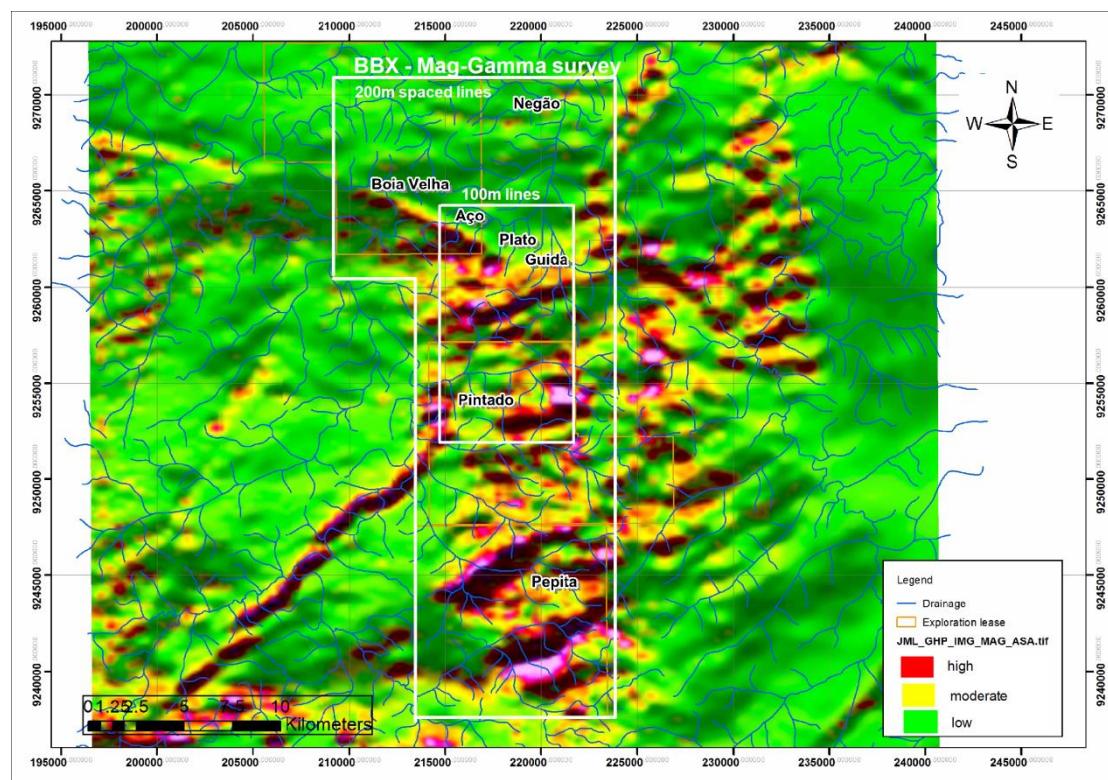

It is anticipated that the survey will commence within 30 days of signing of the contract and that results should be received by early to mid-November 2014.

The only geophysical data currently available is the CPRM Sucunduri project data, recently made public in hard copy map form only, comprising the Analytical Signal + 1st Vertical Derivative aeromagnetics and U+Th+K radiometric data and integrated geological maps. This 500m-spaced data shows a regional scale magnetic signature associated with BBX's targets.

BBX's more detailed survey will be conducted on 200m spaced lines over the entire Juma East tenement block, oriented north-south, infilled to 100 m in the central area covering Guida-Plato-Aço and Pintado (see map A). This will yield data which, when processed and integrated with the geological/structural and geochemical data will generate the first drilling targets at Juma East.

Map B – CPRM's K-Th-U radiometric composite map and BBX airborne survey program.

CGC Airborne

CGG Airborne is an industry-leading airborne geophysics company which acquires electromagnetic, magnetic, radiometric, gravity, and gravity gradiometry data using both fixed-wing airplanes and helicopter platforms.

These services are offered on a global basis, with offices located in various areas of North and South America, Europe, Africa and Australia. CGC are ISO 9001:2000 certified and operate in accordance with international quality management system standards and OHSAS 18001 safety management system standards.

EXPLORATION LEASES -POMBOS

BBX has applied for 5 new exploration leases at Pombos (map C) in the Apui region. The application covers 38,664 ha which will bring BBX's total area held under granted exploration leases or under application to 100,585 ha (table 2).

Pombos is located 30 km north-west of Apui in an area of outcropping Colider Group group rocks. The small eastern tenement covers garimpeiro workings hosted within volcanics and metasediments similar to those at Eldorado do Juma. This region was explored by Western Mining Corporation (WMC) for copper in 2000.

About BBX MINERALS

BBX Minerals Limited (ASX: BBX) is a mineral exploration company listed on the Australian Securities Exchange. Its major focus is Brazil, mainly the southern Amazon, and a region BBX believes is vastly underexplored with high potential for the discovery of world class gold-copper deposits

BBX's key asset is the Juma East Gold Project in the Apuí region – Amazonas State. The company has 38,442 ha of granted exploration leases, 14,287 ha under option at Eldorado do Juma and 47,855 ha of applications in the Colider Group, a highly prospective geological environment for epithermal gold and Au-Cu porphyry deposits. The region is under-explored and could provide BBX with a pipeline of high growth, greenfields gold-copper discoveries.

The following Table and Sections are provided to ensure compliance with JORC Code (2012 Edition).

TABLE 1 – Section 1: Sampling Techniques and Data

Criteria	JORC Code Explanation	Commentary
Sampling Techniques	<ul style="list-style-type: none"> Nature and quality of sampling (e.g. cut channels, random chips, or specific specialised industry standard measurement tools appropriate to the minerals under investigation, such as down hole, gamma sondes, or handheld XRF instruments etc). These examples should not be taken as limiting the broad meaning of sampling. 	<ul style="list-style-type: none"> Soil sampling: sampling has been conducted on surveyed lines, collecting approx. 8 kg of soil from 0,5 m below the organic horizon and pan concentrating in the field to approx. 1 kg sample, recording initial and final weight. Channel chip samples: results are not reported in this announcement Rock chip samples: results are not reported
	<ul style="list-style-type: none"> Include reference to measures taken to ensure sample representivity and the appropriate calibration of any measurement tools or systems used. 	<ul style="list-style-type: none"> All data is stored in the data base following appropriate QA/QC procedures. Sample location by GPS Garmin 60CSx
	<ul style="list-style-type: none"> Aspects of the determination of mineralisation that are Material to the Public Report. In cases 	<ul style="list-style-type: none"> The sampling conducted is on a regional basis, 400m x
