

ASX Announcement

1 October 2018

ONGOING METALLURGICAL EXTRACTION TESTS FROM BOTH TRÊS ESTADOS RC DRILL SAMPLES AND EMA DIAMOND DRILL SAMPLES FURTHER EXTEND DRILL HOLE MINERALISATION ON BOTH TENEMENT AREAS

Highlights:

- The first extraction results from Ema diamond holes EMD-008, EMD-010 and EMD-011 confirm the presence of mineralisation in the quartz-porphyry saprolite (weathered rock) with hole EMD-011 yielding 23.51g/t Au and 2,172.5g/t Ag from 2-6 m.
- Extraction results from TERC-007 further extend the mineralisation to 42m.
- Extraction results from TERC-008 yield 39.86g/t Au from 6-8m in saprolite.
- Three extractions from 24-29m from TERC-009 yield an average of 22.89g/t Au and 131.41g/t Ag
- Extraction results from TERC-008 and EMD-008 and EMD-011 further confirm extensive near surface mineralisation for BBX's planned trial mining operation.

Brazilian gold explorer BBX Minerals (ASX: BBX or "the Company") is pleased to announce results of ongoing metallurgical testing from RC and diamond drill samples from the Company's Três Estados and Ema prospects, respectively, as part of its pilot testing programme (refer announcements dated 14 March 2018, 30 April 2018, 4 June 2018 and 20 August 2018).

The Company has conducted further metallurgical testwork at the Marcelo da Silva Pinto M.E. facility (Marcelo), using the same process as that reported on 20 August 2018 for RC holes TERC-006 and TERC-007 (Três Estados). Eleven tests (22 smelts) were conducted on 5kg samples from two metre intervals from Três Estados RC holes TERC-007, TERC-008 and TERC-009 (see fig 1 and appendix) and Ema diamond holes EMD-008, EMD-010 and EMD-011 (see fig. 2 and appendix), using the same flux components as utilised in previous drill hole testing. Down-hole locations of these extraction results and for tests reported in media releases of 30 April 2018, 14 June 2018 and 20 August 2018 are shown in the appendix. As the style and controls of mineralisation are currently not fully understood no extrapolation of extraction grades or correlation between drill holes can be inferred

TERC-008 and TERC-009 are located approximately 800 metres from TERC-003 and 007 (see fig 3) while the diamond drill holes at Ema are located in the region of old garimpeiro workings where BBX conducted channel sampling (see announcement dated 28 November 2017).

The Ema diamond hole samples were all sourced from quartz-porphyry saprolite (weathered rock), representing the first testwork conducted on this rock type. As the flux mix utilised was developed specifically for testing the mafic intrusives at Três Estados and Ema it is believed that the results obtained for the felsic rocks from the Ema diamond drilling may be sub-optimal. BBX's international consultant team is currently conducting flux modelling to optimise the flux chemistry for treatment of the quartz-porphyry.

After collection, the RC samples were sealed and transported directly to the Nomos laboratory in Rio de Janeiro for preparation and subsequently to the nearby Marcelo facility for treatment. The diamond drill samples were transported initially to SGS in Belo Horizonte for preparation and subsequently to Nomos for splitting. 5kg of each pulverised sample was riffle split and smelted with a specific flux and a copper collector to form a copper-rich bar. One quarter of each bar was dissolved in nitric acid and silver chloride precipitated from the solution by the addition of sodium chloride. The resultant precipitate and the gold-rich undissolved residue were fused to form metallic buttons which were analysed by fire assay using a gravimetric or AA finish. All metallic buttons were closely inspected and where indications of the presence of PGM's was suspected the buttons were dissolved and read on the AA in preference to a gravimetric finish. The other three quarters of each copper bar have been retained for additional testwork. The process was repeated on the slag for each fusion which was ground, re-fused and a second copper bar produced.

The results from the two fusions, summarised in table 1 continue to display variability which BBX believes may be a function of both the smelt and precious metal recovery conditions. Ongoing optimisation and standardisation of smelt conditions, including temperature, smelt time and degree of agitation, and of recovery techniques, including filtration procedures and acid strength may result in improved consistency of results.

In many cases the precious metals are recovered dominantly in the second smelt due to incomplete collection in the first smelt. The complex precious metals association is broken down in the first smelt, releasing the bulk of the precious metals into the slag to enable recovery into the collector metal in the second smelt.

Cautionary Statement

BBX Minerals advises that the announced results are metallurgical test results from 2 metre intervals from the Três Estados and Ema drill holes TERC-007, TERC-008, TERC-009, EMD-008, EMD-010 and EMD-011. The results may not represent the total metal values in the samples, but rather physically extractable gold based on the various extraction/recovery methods currently being tested, and cannot be considered as assay results applicable for ore reserve or mineral resource estimation purposes (see BBX's response to ASX dated 22 and 28^t August 2017 and announcements dated 9 January 2018, 14 March 2018, 30 April 2018, 14 June 2018 and 20 August 2018)

Competent Person Statement

The information in this report that relates to gold mineralization in the Apuí region in Brazil is based on information compiled by Mr. Antonio de Castro, BSc (Hons), MAusIMM, CREA, who acts as BBX's full-time Senior Consulting Geologist through the consultancy firm, ADC Geologia Ltda. Mr. de Castro has sufficient experience which is relevant to the style of mineralisation and type of deposit under consideration and to the activity which he is undertaking to qualify as a competent person as defined in the 2012 Edition of the Joint Ore Reserves Committee (JORC) "Australasian Code for Reporting of Exploration Results, Mineral Resources and Ore Reserves". Mr. Castro consents to the report being issued in the form and context in which it appears.

About BBX Minerals Ltd

BBX Minerals Limited (ASX: BBX) is a mineral exploration and mining company listed on the Australian Securities Exchange. Its major focus is Brazil, mainly in the southern Amazon, a region BBX believes is vastly underexplored with high potential for the discovery of world class gold and copper deposits.

BBX's key assets are the Juma East, Três Estados and Ema Gold Projects in the Apuí region, Amazonas State. The company has 58.1km² of exploration tenements within the Colider Group, a prospective geological environment for epithermal gold and Cu-Au porphyry deposits. The region

	<p>stages to maximise "representivity" of samples.</p> <ul style="list-style-type: none"> Measures taken to ensure that the sampling is representative of the in situ material collected. including for instance results for field duplicate/second –half sampling. Whether sample sizes are appropriate to the grain size of the material being sampled. 	<ul style="list-style-type: none"> No repeat tests were conducted on the samples reported in this announcement The sample sizes collected are appropriate for metallurgical testwork.
Quality of Assay Data and Laboratory Tests	<ul style="list-style-type: none"> The nature quality and appropriateness of the assaying and laboratory procedures used and whether the technique is considered partial or total. 	<ul style="list-style-type: none"> The extraction methodology used comprised: fusion with a copper collector, dissolution of the collector in nitric acid, precipitation of a silver-rich precipitate from the solution, fusion of the precipitate and the undissolved residue into metallic buttons, assaying of the buttons by dissolution with nitric acid to form an AgCl precipitate which is fused into a silver button and weighed, and cupellation of the undissolved residue with lead to form a gold button which is weighed, and the grade back calculated to the original sample weight of 5kg. This process is regarded as appropriate for metallurgical extraction tests. In addition, results are reported for tests using electrolysis instead of nitric acid dissolution of the copper bar. Prior to commencing the fusions the furnace was completely re-lined with a new aluminium refractory cement liner. The furnace is currently dedicated to conducting BBX fusions. As the extraction methodology is still in the developmental phase it may represent only a partial recovery method for gold and other precious metals.

	<ul style="list-style-type: none"> For geophysical tools. spectrometers. hand held XRF instruments. etc. the parameters used in determining the analysis including instrument make and model. reading times. calibrations factors applied and their derivation etc. 	<ul style="list-style-type: none"> No geophysical tools or electronic device was used in the generation of sample results
	<ul style="list-style-type: none"> Nature of quality control procedures adopted (e.g. standards. blanks. duplicates. external laboratory checks) and whether acceptable levels of accuracy (i.e. lack of bias) and precision have been established. 	<ul style="list-style-type: none"> The standard quality control procedures for routine assays of 25 to 50 grams are not applicable to 5kg bulk metallurgical tests. As these are initial metallurgical tests utilising a method still under development there is no statistical basis on which to establish an acceptable level of accuracy and precision. No commercial certified standards are available for this type of material where the nature of the mineralisation has yet to be established. The results obtained by extracting physical gold and silver from bulk samples give an indicative value of how much metal may be extracted using BBX's current extraction process technology, which remains under development. No external laboratory checks have been conducted as the methodology, which is regarded as proprietary has yet to be finalised. The results in this announcement are for indicative metallurgical testwork and do not purport to be in any way representative of an entire geological unit or body. This work is being conducted as a precursor to commencing small-scale trial mining and pilot-scale treatment.
Verification of Sampling and Assaying	<ul style="list-style-type: none"> The verification of significant intersections by either independent or alternative company personnel. 	<ul style="list-style-type: none"> The results presented were not verified by independent or alternative company personnel.
	<ul style="list-style-type: none"> The use of twinned holes 	<ul style="list-style-type: none"> No twinned holes were used
	<ul style="list-style-type: none"> Documentation of primary data. data entry procedures. data verification. data storage 	<ul style="list-style-type: none"> Geological data is logged into Excel spreadsheets at the drill rig for transfer into the drill hole database.
